

## Environmental Policy

Zeppelin Danmark A/S – Power Systems division recognizes that by being a dealer of power solutions and related parts and services we operate in a business with a potentially substantial impact on the environment. It is therefore important to us that our customers and other stakeholders are able to associate us with a company that acts responsibly and always strives for improving the environmental performance and for protecting the environment.

We want to support our customers in taking care of the environment by:

- Being aware of environmental footprints and impacts induced by our products and how to minimize these
- Advising customers regarding choice of solutions from an environmental perspective
- Ensuring that solutions comply with current legislation
- Selecting suppliers based on their ability to meet our requirements – also with regard to the environment
- Advising customers in proper operation and maintenance of their power solutions to reduce fuel, oil consumption, and emissions and to extend the equipment lifetime
- Fully complying with customers' environmental guidelines when working onsite
- Maintaining a conscious use of energy and material and eliminating waste to the extent possible

We want to support Caterpillar in taking care of the environment by:

- Contributing to and actively pushing for development and innovation
- Supplying relevant feedback from customers on environmental issues and requirements
- Promoting new technical solutions with improved environmental profiles

Our environmental management system ensures that we comply with our environmental approval, the corporate guidelines of the Zeppelin Group in relation to the environment and any other standards, legislation and compliance obligations in relation to the environment.

It also ensures that significant environmental aspects and related risks are identified and that proper measures are taken to prevent or mitigate risk of pollution and other environmental impacts.

A positive development of our environmental performance is supported by pinpointing areas for improvement and setting relevant targets and by maintaining and continually improving our environmental management system
